

Infiltration vs. Surface Water Discharge: Development of Guidance for Stormwater Managers

Stormwater managers are increasingly faced with the need to address issues as part of their activities, ranging from flood prevention to protection of downstream habitat. New philosophies, such as a post-development goal of mimicking pre-development hydrology, have been promoted as addressing both the goals of water quality and water quantity control. These new management plans incorporate both infiltration and surface treatment/discharge into the development. A flowchart was developed to aid stormwater managers in stepping through the process of selecting an appropriate management/treatment technology.
